

# RE-FRESH:BLANKET

HEALTHY SOIL. HEALTHY PLANT. HEALTHY YOU.®

A Versatile Garden Product  
Enhancing Weed Control and Soil Health

Re-Fresh Blanket is a remarkable garden product designed to offer cultural control of weeds, improve soil microbiology, generate soil structure, and retain soil nutrients. This innovative cover crop product brings numerous benefits to gardeners and farmers alike.

## WEED SUPPRESSION

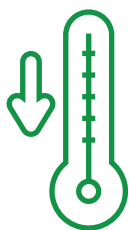

One of the primary functions of Re-Fresh Blanket is its ability to subdue and suppress weeds effectively. By providing a dense ground cover, it limits the sunlight reaching the soil surface, thereby inhibiting weed growth.

## PLANTING AND GROWTH CYCLE

Re-Fresh Blanket is typically planted in late spring or after a crop has been removed from an area where weed control is desired. It establishes quickly, creating massive ground cover and residue that continue to suppress weeds throughout its growth period.

## SEASONAL BEHAVIOR

Re-Fresh Blanket is designed to die when tilled or after the first frost, ensuring it does not survive the winter. This characteristic makes it a manageable and predictable element in crop rotation and weed control strategies.

## NITROGEN SCAVENGING

In addition to its weed suppression capabilities, Re-Fresh Blanket is a fantastic nitrogen scavenger. It absorbs excess nitrogen from the soil, preventing nutrient loss and enhancing soil fertility for subsequent crops.

## SOIL HEALTH IMPROVEMENT

By promoting soil microbiology and generating soil structure, Re-Fresh Blanket contributes to healthier and more productive soils. Its use leads to improved soil aeration, water retention, and nutrient availability, creating a favorable environment for plant growth.

# RE-FRESH:BLANKET

HEALTHY SOIL. HEALTHY PLANT. HEALTHY YOU.®

Re-Fresh Blanket is an invaluable tool for gardeners and farmers seeking to control weeds, enhance soil health, and maintain soil fertility. Its versatility and effectiveness make it a key component in sustainable agricultural practices.
